

# DeLaval Pulsator EP 100

## Precise pulsation in the milking parlor

- The heart of DeLaval pulsator EP100 is a quartz crystal, which resonates with the same precision as a digital watch
- Accurate timing of the intervals between changes in vacuum and air pressure is important for rapid milking and good udder health. These changes are governed by the pulsation rate.
- The pulsation ratio requires accurate timing too. This is important in the relationship between the length of the milking phase and the massage phase - essential for the maintenance of healthy teats and quality milk production
- EP100 has specially designed solenoids which are easy to clean and simple to maintain.
